Precision

A study was conducted at three hospitals using three different lots of product to demonstrate the within run, between run and between operator precision. An identical card of coded specimens, containing drugs at concentrations of negative, 50% and 25% cut-off level, was labeled, blinded and tested at each site. The results gained ≥75% accuracy in ±25% cut-off level specimen and 100% accuracy in negative and ±50% cut-off level specimen.

Analytical Sensitivity

A drug-free urine pool was spiked with drugs at the listed concentrations. The results are summarized below.

Drug Concentration Cut-off Range	ACE 5,000	AMP 1,000	AMP 500	AMP 300	BAR 300	BAR 200	BZO 500	BZO 300

PORTUGUÊS

Teste de painel rápido de despistagem de drogas, múltiplas drogas X(2-20) com/sem adulteração (Urina)

Folheto informativo

Folha de instruções para o teste de qualquer combinação das seguintes drogas:

ACE/AMP/BAR/BZO/BUP/COC/THC/MTD/MET/MDMA/MOP/MOL/OP/PCP/PPX/TCA/TML(TRA)/KET/OXY/COT/EDDP/FYL/K2/6-MAM/MDA/ETG/CLO/LSD/MPD/ZOL/MEP/MDPV/DIA/ZOP/MCAT/7-A-CL/CAF/CFYL/CAT/TRO/ALP/PGB/ZAL/MPRD/CNB/GAB/TZD/CAR/ABP/(K3)/QTP/FLX/UR-144(K4)/KRA/TL-D/ α -PVP/MES/PAP/CIT/FKET/OZP/RPD/TAP/NND/SCOP/MTZ/HMO/ETO/ALC

Incluindo teste da validade das amostras (S.V.T.) para:

Oxidantes/PCC, gravidade específica, pH, nitrito, glutaraldeído, creatinina e lixívia

Um teste rápido para a deteção simultânea e qualitativa de múltiplas drogas e metabólitos de drogas na urina humana.Para profissionais de saúde, incluindo profissionais nos locais do ponto de cuidados.Imuno-ensaio apenas para utilização em diagnóstico in vitro.

UTILIZAÇÃO PREVISTA

O Teste de Painel Rápido de Despistagem de Múltiplas Drogas consiste num imunoensaio cromatográfico rápido para a deteção qualitativa de múltiplas drogas e metabólitos de drogas na urina humana, às concentrações-limite seguintes:

As configurações do Teste de Painel Rápido de Despistagem de Múltiplas Drogas traz qualquer combinação dos analitos das drogas listadas acima com ou sem S.V.T.Este ensaio fornece apenas um resultado de teste preliminar.Deve ser usado um método químico alternativo mais específico com vista à obtenção de um resultado analítico confirmado.A cromatografia gasosa/espectroscopia de massa (CG/EM) é o método de confirmação preferido.Deve aplicar-se a consideração clínica e o juízo profissional a qualquer resultado de teste de droga recreativa, em particular, quando forem indicados resultados positivos preliminares.

RESUMO DA ADULTERAÇÃO

A adulteração consiste na manipulação de uma amostra de urina com a intenção de alterar os resultados de um teste.A utilização de adulterantes pode originar resultados falsos negativos nos testes de despistagem de drogas ao interferirem com o teste de rastreio e/ou ao destruírem a droga presente na urina.Também pode ser empregue diluição numa tentativa de produzir resultados de teste de despistagem de drogas falsos negativos.

Uma das melhores formas de testar a adulteração ou a diluição é determinar certas características da urina tais como o pH, a gravidade específica e a creatinina, e detetar a presença de oxidantes/PCC, nitríto ou glutaraldeído na urina.

PRINCÍPIO (PARA TESTES DE DROGAS RECREATIVAS À EXCEÇÃO DE ÁLCOOL)

Durante o teste, a amostra de urina migra para cima por ação capilar.Uma droga, se presente na amostra de urina abaixo da concentração-limite, não irá saturar os locais de ligação do anticorpo específico.O anticorpo irá então reagir com o conjugado droga-proteína e surgirá uma linha colorida visível na região de teste da tira da droga específica.A presença da droga acima da concentração-limite irá saturar os locais de ligação do anticorpo.Por conseguinte, a linha colorida não se irá formar na região de teste.

Uma amostra de urina positiva para droga não irá gerar uma linha colorida na região de teste específica da tira devido à competição da droga, enquanto uma amostra de urina negativa para droga irá gerar uma linha na região de teste devido à ausência de competição da droga.

Para servir como um controlo do procedimento, uma linha colorida irá sempre aparecer na região de controlo, a indicar que foi adicionado um volume de amostra adequado e que ocorreu a absorção da membrana.

PRINCÍPIO DE ADULTERAÇÃO

Oxidantes/PCC (Clorocromato de piridínio) testa a presença de agentes oxidantes tais como lixívia e peróxido de hidrogénio.O clorocromato de piridínio (vendido sob o nome comercial Urine Luck) consiste num adulterante comumente utilizado.2 A urina humana normal não deverá conter oxidantes de PCC.

A gravidade específica testa a diluição da amostra.O intervalo normal é de 1,003 a 1,030.Os valores fora deste intervalo podem ser o resultado da diluição ou da adulteração da amostra.

O pH testa a presença de adulterantes ácidos ou alcalinos na urina.Os níveis de pH normais devem estar no intervalo de 4,0 a 9,0.Os valores fora deste intervalo podem indicar que a amostra foi alterada.

O nitrito testa quanto a adulterantes comerciais comumente utilizados tais como Klear e Whizzies.Funcio-nam oxidando o principal metabólito canabinoide THC-COOH.3. A urina normal não deverá conter vestígios de nitrito.Resultados positivos geralmente indicam a presença de um adulterante.

O glutaraldeído testa a presença de um aldeído.Adulterantes tais como Urin Aid e Clear Choice contêm glutaraldeído, o que pode causar resultados falsos negativos pela disrupção da enzima usada nalguns testes de imunoensaio.3 O glutaraldeído normalmente não é encontrado na urina; por conseguinte, a deteção de glutaraldeído na amostra de urina é geralmente indicativo de adulteração.

A creatinina é um produto da degradação da creatina, um aminoácido contido no tecido muscular, e é encontrada na urina.1 Uma pessoa pode tentar contornar um teste bebendo quantidades excessivas de água ou diuréticos tais como chás de plantas, para "lavar" o sistema.A creatinina e a gravidade específica são duas formas de verificar a diluição e a lavagem, que são os mecanismos mais comuns usados numa tentativa de contornar o teste de despistagem de drogas.Níveis baixos de creatinina e gravidade específica podem ser indicativos de urina diluída.A ausência de creatinina (<5 mg/dL) é indicativa de uma amostra que não é compatível com urina humana.

A lixívia testa a presença de lixívia.A lixívia diz respeito a uma série de produtos químicos que removem a cor, branqueam ou desinfetam, muitas vezes por oxidação. As lixívias são usadas como produtos domésticos para branquear a roupa e remover as manchas, e como desinfetantes.A urina humana normal não deve conter lixívia.

PRINCÍPIO (PARA ÁLCOOL)

O Teste de Painel Rápido de Despistagem de Álcool consiste numa tira de plástico com uma almofada de reação colada na ponta.Em contacto com o álcool, a almofada de reação irá mudar de cor dependendo da concentração do álcool presente.Isto baseia-se na elevada especificidade da álcool oxidase para o álcool etílico na presença de peroxidase e de substrato enzimático tal como TMB.

REAGENTES (PARA TESTES DE DROGAS RECREATIVAS À EXCEÇÃO DE ÁLCOOL)

Cada linha de teste contém um anticorpo monoclonal de ratinho anti-droga e correspondentes conjugados droga-proteína.A linha de controlo contém anticorpos policlonais IgG anti-coelho de cabra e IgG de coelho.

REAGENTES (PARA ÁLCOOL)

Tetrametilbenzidina, álcool oxidase, peroxidase

REAGENTES S.V.T

Adulteration Pad	Reactive indicator	Buffers and non-reactive ingredients
Creatinine	0.04%	99.96%
Nitrite	0.07%	99.93%
Bleach	0.39%	99.61%
Glutaraldehyde	0.02%	99.98%
pH	0.06%	99.94%
Specific Gravity	0.25%	99.75%
Oxidants/PCC	0.36%	99.64%

PRECAUÇÕES

* Para profissionais de saúde incluindo profissionais nos locais do ponto de cuidados.

* Imunoensaio apenas para diagnóstico in vitro.O teste deve permanecer numa bolsa selada até à utilização.

* Todas as amostras devem ser consideradas potencialmente perigosas e manuseadas da mesma forma que um agente infecioso.

* O teste usado deve ser eliminado de acordo com os regulamentos locais.

ARMAZENAMENTO E ESTABILIDADE

Armazenar conforme embalado numa bolsa selada a 2-30°C. O teste é estável até à data de validade impressa na bolsa selada.O teste deve permanecer numa bolsa selada até à utilização.NÃO CONGELAR. Não utilizar para lá da data de validade.

COLHEITA E PREPARAÇÃO DA AMOSTRA

Ensaio de urina

A amostra de urina deve ser colhida num recipiente limpo e seco.Pode ser usada urina colhida em qualquer momento do dia.Amostras de urina que exibam precipitados visíveis devem ser centrifugadas, filtradas ou permitidas depositar para obter uma amostra transparente para teste.

Armazenamento da amostra

As amostras de urina podem ser armazenadas a 2-8°C durante até 48 horas antes do teste.Para o armazenamento prolongado, as amostras podem ser congeladas e armazenadas abaixo de -20°C. As amostras congeladas devem ser descongeladas e bem misturadas antes do teste.Ao testar cartões com S.V.T. ou álcool o armazenamento de amostras de urina não deve ultrapassar as 2 horas à temperatura ambiente ou 4 horas refrigeradas antes do teste.
